Watt is a unit of power, not a unit of energy. Battery storage is given as energy, usually mAh or Wh or similar. Because the efficiency of a UPS varies with load, there's no point giving a battery storage number, because even if the Battery can hold 200Wh, if you're drawing 1000W it won't last 1/5th of an hour because efficiency losses.

If your 1000 watt solar system produces 5000 watts and you only use 3000 watts, the rest are put in the battery bank so it can be used later. But if you consume all 5000 watts in five hours, it might be time for an upgrade. A 1000 watt array can only supply 5kwh during the summer. Production will drop to 4000 watts or lower during the other ...

A 48V battery rated for 750W is only good for around 16A of current. Best case scenario, you'll trip the BMS in that battery constantly. Worst case, the cells will heat up at enter thermal runaway. You need a 25A capable battery for that 25A controller.  $25A \times 48V = 1,200W$ , so look for a battery that is rated for either 25A or 1,200W.

Pulsar 1000 model PPS1000 has 888 watt hours available, 1000 maximum watts total draw. I attached it to a 350 watt portable heater and it ran for 3 hours 17 minutes. I attached it to a 1000 watt heater and it ran for 1 hour 12 minutes, which seemed quite good for such a small battery package. I ran a drill and a circular saw with it.

The formula to calculate the required battery capacity is as follows: Battery Capacity (Ah)=Inverter Wattage\*Usage Time/(Battery Voltage\*Inverter Efficiency) Example Calculation. For instance, if you have a 1000 watt inverter and desire a usage time of 2 hours with a 12V battery system and 90% inverter efficiency, the calculation would be:

PREPARE FOR HURRICANES: The Explorer 1000 power station can hold power on standby for more than a year, offering reassurance during hurricane seasons and power outages.
