

How will the 2023 mini-grid regulations impact Nigeria?

The 2023 Mini-Grid Regulations indeed marks a significant shift towards a more efficient and predictable regulatory environment for mini-grid development in Nigeria. For investors, the portfolio approach and simplified tariff filing methodology offer greater flexibility and reduced administrative burdens.

Which power conversion technology is used in Nigeria?

Apart from thermal power, hydropower plants is another power conversion technology that has been utilized in meeting some of the electricity requirements of Nigeria. It was estimated that hydropower connected capacity in the country is 2380 MW, making the harvested resource a little above 14% of its overall potential.

Is the energy crisis powering a different kind of innovation in Nigeria?

However, this energy crisis is now powering a different kind of innovation in Nigeria, says Ifeoma Malo, chief executive of Clean Technology Hub, a renewable energy research institute. She points to government regulations designed to encourage investment in solar mini-grids that can supply electricity to remote areas.

Which Nigerian states are a viable source of wind energy development?

Most of the northern states of Nigeria have proven to be viable for wind energy development, namely, Kano, Jos, Sokoto, Gasau, Katsina, etc. Additionally, some parts of the south attract off-grid wind development, especially during the windy season of the year.

When did Nigeria become a micro-grid?

The two micro-grids were merged in 1972; the merger gave birth to the National Electric Power Authority (NEPA), a statutorily given the monopoly to drive the entire power sector of Nigeria until 2005 when it was disbanded to involve the participation of the private sector; see Fig. 2 for the evolution of the power sector in Nigeria.

Can Nigeria sustainably meet its electricity needs?

Irrespective of this deficiency in power generation in Nigeria, the country can sustainably meet all its electricity needs having been well situated where it has huge potentials for fossil fuel sources and renewable energy (RE) sources, such as wind, solar, biomass, geothermal, large- and small-hydro power and in fact, tidal energy.
